Question 1: Django Introduction & Architecture

- **What is Django and why is it used?**
  Django is a high level and open source web python framework which is used to building secure , maintainable and scalable web applications.

- **Write down 5 important features of Django**
  1. Django have a built in admin panel
  2. Django gives us more security
  3. Django projects can be scalable
  4. Django provides flexible url routing
  5. Django allows ORM(Object Relational Mapping)

- **What is the difference between MVC and MVT architecture?**
  MVC: MVC stands for Model View Controller. Where Controller handles user requests and application logic. View is used for presenting data to users
  MVT: MVT stands for Model View Templates. Where view handles user requests and application logic. Templates used for presenting data to users

- **Explain the roles of Model, View, Template and URL in Django.**
  Model: Model is used for managing application data and database operations.
  View: View handles user requests and application logic.
  Template: Template is used for presenting data to the users.
  URL: Url used for driving user one page to another or it's corresponding view

Question 2: Django Project Setup

- Virtual Environment create:
  python3 -m venv venv

- Activate Virtual Environment:
  source venv/bin/active

- Install Django:
  pip install django

- Create Django project:
  django-admin startproject project_name .

- **Manage.py:** Manage.py is used for manage the django project like running projects or creating apps etc.

- **Settings.py:** Settings.py contains django projects configurations,installed apps, database setting and security settings.

- **URL.py:** Urls.py defines url pattern and connects urls with their corresponding views.

- **WSGI.py:** wsgi.py Provides an entry point for deploying the Django application using WSGI compatible web servers.

- **To run Django Development Server:**
  First of all needs to migrate existing models with command of:
  python3 manage.py migrate

  Secondly run the projects with command of:
  python3 manage.py runserver
